This 12.8 kb DNA sequence spans the region from -6.65 kb relative to the transcriptional start site to +6.15 (located in the third exon) of the murine endothelial growth factor (VEGF) receptor-2 gene for Fik-1. This portion of the Fik-1 gene was isolated from the liver of mouse strain 129/SvJ by screening a phage library of liver internation for the gene from the six significant he 5'-flanking region of the gene, in combination with sequences located within the first intron, specifically and reproducibly target expression of heterologous DNA to angloblasts during early stages of vascular equilatory sequences of the first intron also function as an autonomous endothelium specific enhancer when fused to a autonomous endothelium specific enhancer when fused to a neuron factors of the Ets and GATA families. The invention provides a new claimed recombinant DNA (I) comprising at least one regulatory sequence from an intron of the Fik-1 gene, or its homologue, to control expression in endothelial cells, in vivo, linked to (b) a

these, or transformed cells, are used to identify agents (A), these, or transformed cells, are used to identify agents (A), these, or transformed cells, that suppress, activate or enhance transcription of genes in endothelial cells. (I), vectors and (A) are used to direct or prevent (for antisense sequences) expression of genes specifically in endothelial cells, e.g. for treating angiogenesis, cancer, diabetic retinopathy, rheumatoid arthritis etc., and in wound healing, particularly for treating vascular cisease (particularly proliferation of smooth muscle cells, specifically atherosclerosis), tumours and neuronal disorders. They may also be used to induce vascular disease in the transgenic animals or diagnostically, particularly for studying (mal)function, interactions and unregulated expression of endothelial products. (I) provide specific modulation of gene expression in endothelial

cells preferably nerve axons or dendrites, leukocytes or malignant cells expressing roundabout (robo) protein, by repulsion or inhibition. Also, the slit protein is useful for treating graft rejection, inhibiting the infection of a cell by HIV, inhibiting inflammation and in aiding wound for the treatment of conditions involving the migration of leukocytes, such as asthma, arthritis, glomerulonephritis, cystic fibrosis, ulcerative colitis, Crohn's disease, multiple sclerosis, allergic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Piwi family nucleic acids, polypeptides, and antibodies, useful in gene therapy of diseases such as cancer and in various research and

The corresponding human gene (X83001) encodes a protein related to Werner's syndrome. The products can be used for the detection and treatment of Werner's syndrome (MS), an autosomal recessive disorder with a complex phenotype, as well as related diseases.
                                                                     miwi. The piwi family nucleic acids and polypeptides are used in gene therapy of diseases such as cancer and also in various research and diagnostic applications. The sequences can also be used to treat

Calcium ion channel alphal subunit exon 15/intron partial sequence.

(first entry)

31-JUL-1998

V29343;

```
intronic sequences containing the complete coding region of the human calcium ion channel alpha 1 subunit gene and part of untranslated sequences. The channel is related to familial hemiplegic migraine (FHM) and/or episodic ataxia type 2 (EA-2) and is derived from, related to or associated with a gene present in humans on chromosome 19p13.1-13.2. The encoding gene can be used to localise or identify genes related to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequences shown in V29330 to V29371 represent the 47 exons and flanking

repopulating haematopoietic progenitor cells (LTR-HPC), by comparing the expression of tissue transglutaminase (tTGase), a calcium dependent enzyme, in myeloid cells like blood or marrow to a standard. A higher level of tTGase expression, indicates the presence of LTR-HPC in the sample. Tissue TGase catalyses post-translational modification of proteins and is involved in appotosis, cell adhesion, metastasis and extracellular matrix (ECM) assembly. It acts as a marker that distinguishes the LTR-HPC from other (im)mature blood cells and is also useful for improved quantification of a mammal's haematopoietic competence. The method is useful for functional selection of progenitor cells, enabling allogeneic transplant procedures and ex vivo manipulation of HPC for use in gene therapy. The present sequence

The patent discloses a method of differentially identifying long-term

episodic neurological disorders, specifically migraine, FHM or EA-2, but also epilepsy. The isolated or a recombinant nucleic acid can also be used to distinguish between alleles of the corresponding gene. Cells and animals containing recombinant expression vectors comprising the nucleic acid can be useful in study, development and treatment of migraine, FHM, EA-2 and epilepsy. Proteins or peptides encoded by the nucleic acid and natural or synthetic antibodies against the proteins can be used to diagnose FHM, EA-2, migraine and other neurological conditions associated with cation channel disfunction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a library of human polynucleotides comprising the sequences given in 212532 to 217779. Also described is a method of detecting differentially expressed genes correlated with the

```

```
cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by one of the 5248 polynucleotide sequences given in 212532 to 217779. The polynucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, mapping, itssue typing or profiling, forensics, genetic analysis and detection of polymorphisms. Polypeptides encoded by the polynucleotides can be used for raising antibodies for experimental, diagnostic and therapeutic purposes. The polynucleotides may also be used to construct arrays for diagnostics (which may be used to determine function of an encoded protein); and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to identify a genetic predisposition or susceptibility to a disease such as diagnosis, prognosis and management of colorectal cancer, breast cancer, papiling analysises and antanomic can also be used to screen for partial analysis and analysis can also be used to screen for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Tango-77; human; IL-1ra; cytokine superfamily; inflammation; inhibition; interleukin-1 receptór; IL-1R; regulation; asthma; rheumatoid arthritis; chronic myelogenous leukaemia; psoriasis; inflammatory bowel disease; growth factors; treatment; IL-1 receptor complex; BAC; ss.

                                                                                       X02956-X03048 and X22301-X22304 are overlapping BAC genomic sequences containing alternatively spliced forms of human IL-1ra. Such fragments are used in the method of the invention which describes the isolation of a novel human TRNGO-77 encoding nucleic acid and protein. Tango-77 is a member of the cytokine superfamily that is expected to inhibit inflammation by binding to the interleukin-1 receptor (IL-1R). It may also bind to a new receptor so could regulate other cellular processes associated with acute or chronic inflammation, e.g. asthma, chronic myelogenous leukaemia, rheumatoid arthritis, psoriasis and inflammatory bowel disease. It may also induce or suppress interleukins, cytokines and growth factors. Modulators of this protein are used to treat or prevent conditions associated with abnormal levels of inflammation, or activity of IL-1 or its receptor complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Apo A1; low density lipoprotein; LDL; blood; therapy; atherosclerosis; high density lipoprotein; HDL; cholesterol; coronary heart disease; Alzheimer's disease; hypobetalipoproteinemia; dysbetalipoproteinemia; ds.

hyperlipidemia by altering genes, in hepatocytes, for apoprotein (apo) B, E or Al. Low density lipoprotein (LDL) levels in the blood are reduced by altering an apo B gene (I) in a hepatocyte. The invention describes a method for the therapeutic and/or prophylactic method involving altering an apo B gene in hepatocytes by introducing the mutations Argli2Cys, Argl5Gys or Cysl5BArg and a method for ameliorating atherosclerosis by altering the apo Al gene in a hepatocyte so that the altered protein can dimerize. Altering expression of apo genes regulates levels of high and low density lipoprotein cholesterol. Altering expression of apo B, E and Al genes is used to treat or prevent atherosclerosis, coronary heart disease, Alzheimer's disease, hypobetalipoproteinmia, and dysbetalipoproteinmia. This sequence encodes the human Apo Al protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1310 ctcttctgagacagagtctcactgtgtggcccaggctagtctcaaacttgcggtccattt 1369

                                                                                                                                                                                                                                                                                                                                                                                                                        A 14507 bp DNA sequence (T73568) comprises a novel transcription regulatory element, expression augmenting sequence element (EASE), that facilitates high expression of recombinant proteins in mammalian host cells. It was identified by cloning the integration site of a unique expression cassette encoding recombinant dimeric tumour necrosis factor receptor immunoglobulin Fc fusion protein from genomic DNA of a CHO 2AS-3 cell line expressing this protein at a high level. Expression vectors incorporating an EASE show a 2-to 8-fold improvement of recombinant protein expression levels in CHO host cells. The EASE sequence also facilitates high
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 EASE; expression augmenting sequence element; chinese hamster; ds.
            "the EASE sequence is preferably ligated to DNA comprising nucleotides 14290-14507 (Claim 3)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1.9%; Score 42.2; DB 18; Length 14507; 59.9%; Pred. This invention describes a novel expression augmenting sequence element (EASP) (1) isolated from Chinese hamster ovary cells. (1) facilitates high expression of recombinant proteins in mammalian host cells in a short time period. (1) is used for improving expression of recombinant proteins 2-8 fold in stable cell pools when it is present in an expression vector. (1) improves recombinant protein expression in mammalian cells and facilitates the use of mammalian cells in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DE X L X X X
                                                                                                                                                                                                                                                                                                                                     This invention describes novel isolated human secreted proteins and their encoding nucleic acid sequences. The products of the invention are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the presence or amount of expression of the new polypeptides in a sample or by determining the presence or absence of mutations in the new polypucleotides. Specific uses are absence of mutations in the new polypucleotides specific uses are described for each of the 70 polynucleotides, based on which tissues they are most highly expressed in, and include developing products for the disorders, developmental abnormalities and foetal deficiencies, blood disorders, leukemias, diseases of the immune system, autoimmune diseases, hepatic and renal disease, lymphomas, inflammation, allergies, asthma, sepsis, diabetes, Alzheimer's and cognitive disorders, schizophrenia, osteoporosis, arthritis, psoriasis, digestive/endocrine disorders, infections and AIDS: The human secreted proteins of the invention are represented in X07744-Y07860 and the encoding nucleic acids are

C97991 to C98763 encode the human colon cancer associated proteins, called human colon cancer antigens, given in B53234 to B54006. The human colon cancer antigens can have cytostatic, cardioactive, muscular;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Colon cancer associated gene sequences, referred to as colon cancer antigens, useful for the treatment, prevention, and diagnosis of colon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        neuroprotective, immunomodulatory, gynaecological, gastrointestinal, vulnerary, nephrotropic, antilnfective and antibacterial activities, are no be used in gene therapy. The colon cancer antigen polynucleotides, proteins and antibodies to the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The polynucleotides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1267 ttagaaagcctggatgcctgcctgctattaattagttattcttcttcttctgagacagagt 1326

New isolated human genes and the secreted polypeptide(s) they encode - useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders

Claim 1; Page 333-334; 721pp; English.

This sequence represents a nucleic acid molecule designated Gene 101 from the human cDNA clone HLQAB52 (deposited as clone ATCC 97901 and ATCC 209047) which encodes a secreted human protein. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. V59502) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 186 novel genes and their fragments (nucleic acid sequences: V59511-V59812; amino acid sequences W74731-W75026) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions e.g. by protein or gene therapy. Also, pathological conditions and be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides.

It currently consists of 38 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N. but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Contact: sequence_submissions@genome.wi.mit.edu

consists of % contigs. The true order of the pieces

* is not known and their order in this sequence record is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Center code: WIBR

* NOTE: This is a 'working draft' sequence. It currently
* consists of 16 contigs. Gaps between the contigs
* are represented as runs of N. The order of the pieces
* are represented as runs of N. The order of the pieces
* is believed to be correct as given, however the sizes
* of the gaps between them are based on estimates that have
provided by the submittor.
* This sequence will be preserved.

Genes and Regions of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to EST and cDNA sequences in Unigene. Genes demonstrate at least two exons flanked by consensus splice sites that maintain sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.

SEQUENCING READ COVERAGE: Attempts are made to complete double stranded sequence for all regions. All sequence is completed to a standard of coverage with a minimum of 3 reads with no ambiguities. If the sequence coverage for a region does not meet this standard, it is indicated in the annotation as Low Coverage. Low coverage Inhakages are verified by PCR product size verification or verification of forward and reverse reads from clones which span the low coverage area.

QUALITY OF INDIVIDUAL BASES: This sequence meets stringent quality standards - estimated average error rate is less than 1 per 10,000 bases using the Consed quality parameters. Regions that do not meet this requirement are annotated as Low Quality.

ANNOTATION OF FEATURES: STSS are identified using ePCR (Genome Res. 7:541-550). Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

CLONE LENGTH: This sequence represents the entire insert of this clone unless otherwise noted. If there are overlapping clones, the overlaps are noted in the beginning and end of the Features

It currently consists of 38 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as * runs of N, but the exact sizes of the gaps are unknown. * This record will be updated with the finished sequence * as soon as it is available and the accession number will * be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequencing vector: plasmid; 13% of reads Chemistry: Dye-primer ET; 87% of reads Chemistry: Dye-primer ET; 87% of reads Assembly program: Phrap; version 0.990319 Consensus quality: 195065 bases at least Q40 Consensus quality: 200600 bases at least Q20 Consensus quality: 203756 bases at least Q20 Insert size: 161000; agarose-fp Insert size: 210648; sum-of-contigs Quality coverage: 4.96 in Q20 bases; sum-of-contigs Quality coverage: 4.62 in Q20 bases; sum-of-contigs
